5. How .Net runtime generates executable files from your code?

-> Source code written in C# is compiled into an intermediate language (MSIL) code. MSIL code is independent from OS. MSIL code is generated after the build. MSIL code is not in the binary format. Then MSIL code is given to JIT(Just In Time) where it gets converted into particular binary format(Mac,Linux,Windows). CLR gives call to JIT and exe is generated.
